- 动态flag

知识点

1. 脚本编写

解题步骤

根据《个人信息数据规范文档.pdf》编写脚本

密码判断：

```
def check_password(password) -> bool:
    """
    检查密码是否符合要求
    :param password: 密码字符串
    :return: 如果符合要求返回True，否则返回False
    """
    if len(password) < 8:
        return False
    if not any(c.isupper() for c in password):
        return False
    if not any(c.islower() for c in password):
        return False
    if not any(c.isdigit() for c in password):
        return False
    if not any(not c.isalnum() for c in password):
        return False
    return True
```

身份证判断：

```
def check_id_card(id_card) -> bool:
    """
    检查身份证号码是否符合要求
    :param id_card: 身份证号码字符串
    :return: 如果符合要求返回True，否则返回False
    """
    if len(id_card) != 18:
        return False
```

```

weights = [7, 9, 10, 5, 8, 4, 2, 1, 6, 3, 7, 9, 10, 5, 8, 4, 2]
checksum = sum(int(id_card[i]) * weights[i] for i in range(17)) % 11
check_digit = "10X98765432"[checksum]
return id_card[-1] == check_digit

```

手机号分组

```

def group_phone(phone) -> str:
    """
    将手机号头前三位进行运营商分组
    :param phone: 手机号码字符串
    :return: 分组后的运营商名 CMCC CUCC CTCC
    """
    CMCC_list = [134, 135, 136, 137, 138, 139, 144, 147, 148, 150, 151, 152, 157,
158, 159, 172, 178, 182, 183, 184, 187, 188, 195, 197, 198] # 134, 135, 136, 137,
138, 139, 144, 147, 148, 150, 151, 152, 157, 158, 159, 172, 178, 182, 183, 184, 187,
188, 195, 197, 198
    CUCC_list = [130, 131, 132, 145, 155, 156, 166, 167, 171, 175, 176, 185, 186,
196] # 130, 131, 132, 145, 155, 156, 166, 167, 171, 175, 176, 185, 186, 196
    CTCC_list = [133, 149, 153, 173, 177, 180, 181, 189, 190, 191, 193, 199] #
133, 149, 153, 173, 177, 180, 181, 189, 190, 191, 193, 199
    head = int(phone[:3])
    if head in CMCC_list:
        return "CMCC"
    elif head in CUCC_list:
        return "CUCC"
    elif head in CTCC_list:
        return "CTCC"

```

完整脚本

```

def check_password(password) -> bool:
    """
    检查密码是否符合要求
    :param password: 密码字符串
    :return: 如果符合要求返回True, 否则返回False
    """
    if len(password) < 8:
        return False
    if not any(c.isupper() for c in password):
        return False
    if not any(c.islower() for c in password):
        return False
    if not any(c.isdigit() for c in password):
        return False
    if not any(not c.isalnum() for c in password):
        return False
    return True

def check_id_card(id_card) -> bool:
    """

```

```

检查身份证号码是否符合要求
:param id_card: 身份证号码字符串
:return: 如果符合要求返回True, 否则返回False
"""

if len(id_card) != 18:
    return False

weights = [7, 9, 10, 5, 8, 4, 2, 1, 6, 3, 7, 9, 10, 5, 8, 4, 2]
checksum = sum(int(id_card[i]) * weights[i] for i in range(17)) % 11
check_digit = "10X98765432"[checksum]
return id_card[-1] == check_digit

def group_phone(phone) -> str:
    """
    将手机号头前三位进行运营商分组
    :param phone: 手机号码字符串
    :return: 分组后的运营商名 CMCC CUCC CTCC
    """

    CMCC_list = [134, 135, 136, 137, 138, 139, 144, 147, 148, 150, 151, 152, 157,
158, 159, 172, 178, 182, 183, 184, 187, 188, 195, 197, 198] # 134, 135, 136, 137,
138, 139, 144, 147, 148, 150, 151, 152, 157, 158, 159, 172, 178, 182, 183, 184, 187,
